MALARIA ANTIGEN :

Result :-

Plasmodium Vivax - Negative

Plasmodium Falciparum - Negative

Method : Rapid card test (Sandwich Immunoassay)

REMARKS :-

The test detects parasitemia levels of 100 - 200 parasites per uL of blood. It detects the presence of Plasmodium lactate dehydrogenase, an enzyme produced by all forms of the parasite, using monoclonal antibodies against the enzyme.

COMMENT / NOTE : This is screening test only having high sensitivity & specificity. However, false positive & false negative may occur in certain circumstances. Correlation with peripheral blood smear is recommended if necessary.

CLINICAL BIOCHEMISTRY

Test	Result	Biological Ref Interval	Units
25(OH) VITAMIN D	21.70	30-100 Sufficient <20 deficient 20-<30 Insufficient >100 Potential Toxicity.	ng/ml

(Enhanced chemiluminescence)

Comments : Assay precision $\leq 10\%$ total CV
 - Limitations of the procedure:-

Heterophile antibodies in human serum can react with **[REDACTED]** immunoassays. patients routinely exposed to animals or to **[REDACTED]** products can be prone to this interference and anomalous values may be observed. Additional information may be required for diagnosis.

PARATHYROID HORMONE (PTH) **115.00** 15 - 65 pg/ml

(Enhanced chemiluminescence)

Comments : Parathyroid hormone (PTH) is a single chain 84 amino acid polypeptide produced by the parathyroid gland. After PTH is secreted into the blood stream it undergoes extensive proteolysis to generate various fragments. In contrast to its degradation products, the concentration of Intact PTH is relatively independent of glomerular filtration rate and reflects the biologically active portion of the hormone. Guidelines from the National Academy of Clinical Biochemistry recommend the use of intraoperative parathyroid hormone testing for patients during surgery for hyperparathyroidism, especially in minimally invasive or directed procedures, as well as for patients undergoing reoperation. For patients undergoing parathyroidectomy it is recommended that preoperative and pre-excision samples are taken. Samples should also be drawn at 5 and 10 minutes post resection and a >50% reduction in PTH levels from the highest baseline may be used as criteria for surgical success. Test results should be interpreted in conjunction with serum calcium and phosphorus levels and clinical finding. As per KDIGO guidelines, the PTH concentration of patients treated by dialysis should be maintained within two to nine times the upper normal limit of the assay (VIDAS PTH interval in such patient is 89.2 – 401.4 pg/ml).

PATIENT NAME	: Mr. SHIV KUMAR GARG	UHL No	: 127234
Ref By	: Self	Sample Collection	: 12:35 PM
Room_no	: 120	Signed Off	: 04:00 PM
		Report Status	: Final

Test	Result	Unit	Biological Ref. Interval
TIBC(TOTAL IRONBINDING CAPACITY)	345.0	ug/dL	250 - 400
SERUM IRON	65.0	ug/dL	60 - 160
SATURATION Method : (FERROZINE METHOD)	18.8 L	%	20 - 50
FERRITIN Method : (ELFA METHOD)	168.3	ng/mL	30 - 350

RBCs:- Are adequate in no. & predominantly are microcytic hypochromic with mild anisocytosis.
WBCs:- Are showing neutrophilic leukocytosis with left shift & toxic granulation of few neutrophils.
Platelets :- Are adequate in no. & normal in morphology.
No haemoparasite seen.
